

Introduction to Global Positioning System (GPS)

Surapon Yimsamran

Department of Tropical Hygiene
Faculty of Tropical Medicine
Mahidol University

What is GPS?

- The GPS is a satellite navigation system designed to provide instantaneous position, velocity and time information
 - The GPS was developed by the U.S. Dept. of Defense for military purposes
- 

What is GPS?

- Now it can be used world-wide by any civilian free of charge
- Entire system is comprised of three segments:
 1. Control segment
 2. Space segment
 3. User segment

Control Segment

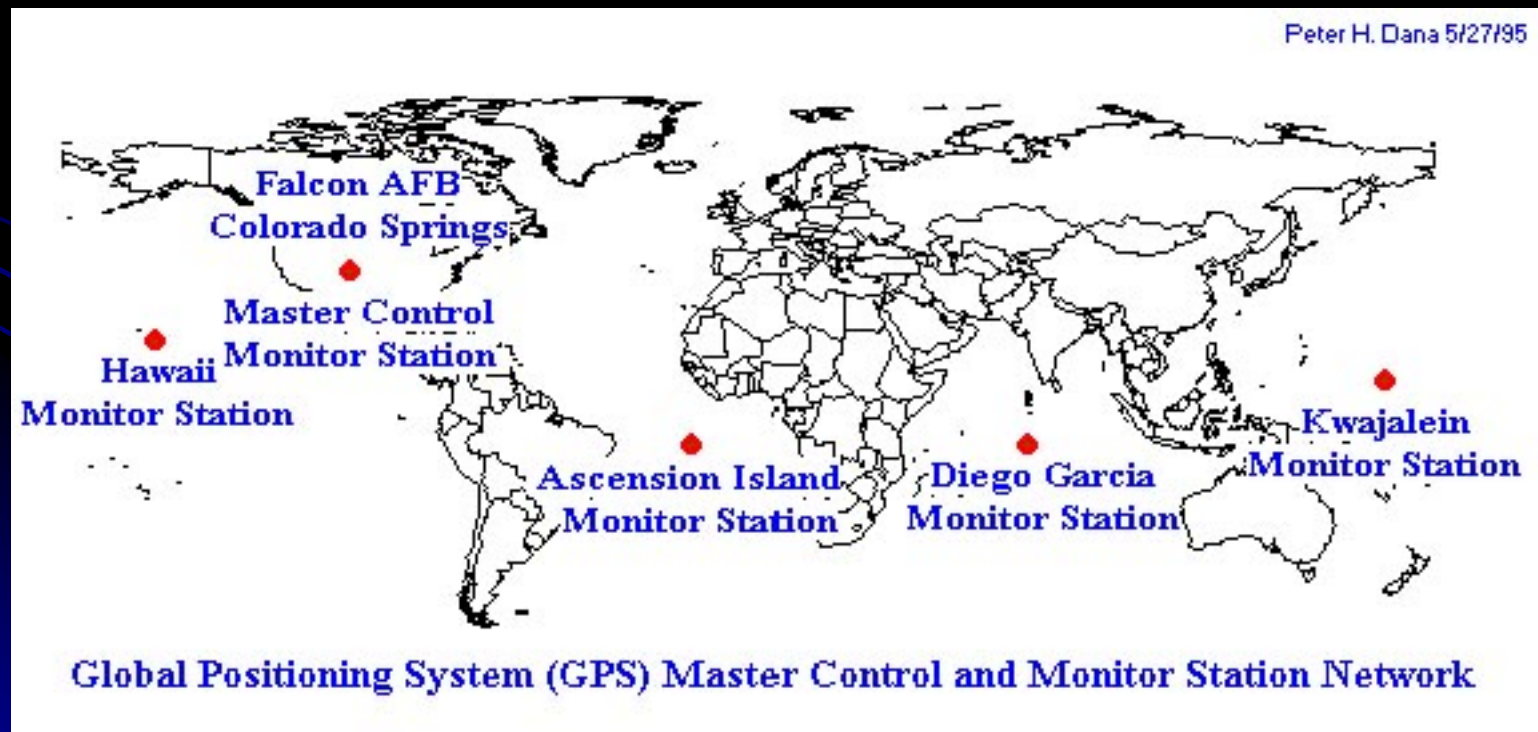

- The “Brain” of the system
- Controlled by the U.S. Government
- Monitors the satellite’s navigation messages and sends adjustments if necessary

Control Segment

- Contains 1 control station and 4 monitor stations throughout the world
- Each satellite passes over a monitoring station daily

Space Segment

- Comprise of 24 operating satellites needed for system to be fully operational

NAVSTAR

Space Segment

- 6 orbital planes
- each plane has 4 satellites
- 20,200 km orbit
- 1 revolution every 12 hours

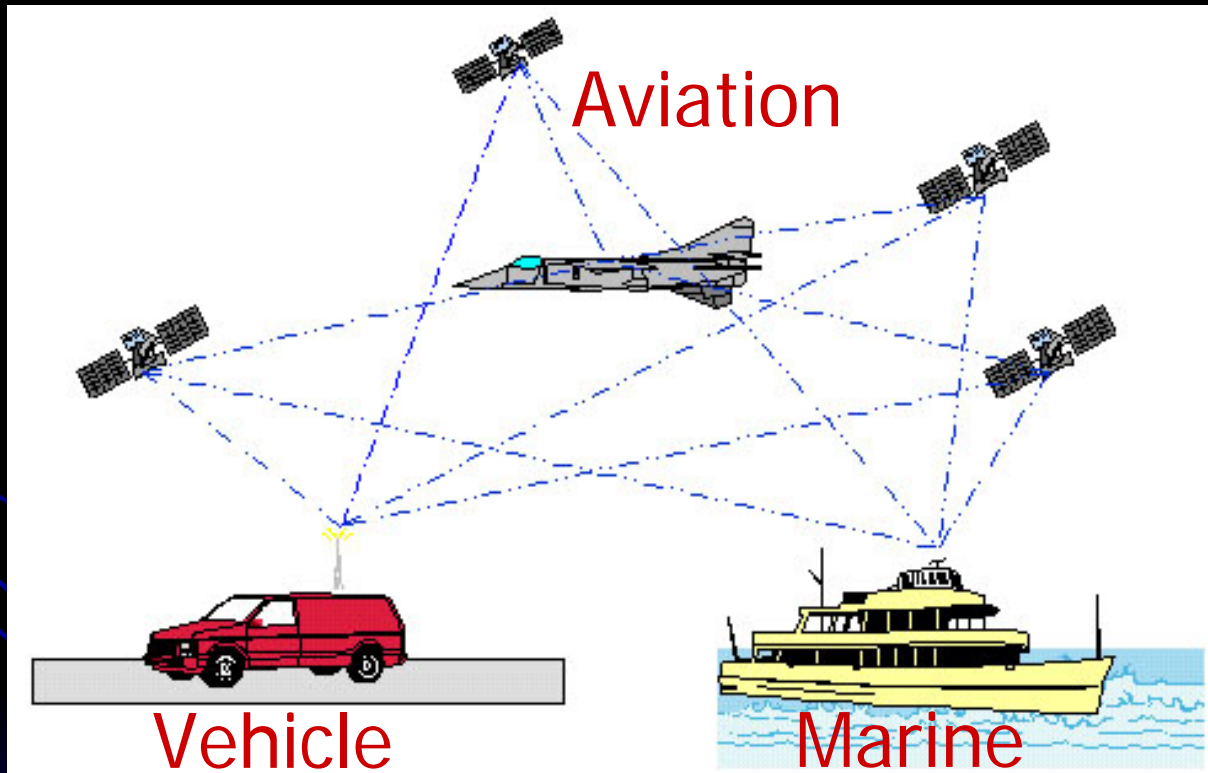

User Segment

- Civilian users
- Military users

GPS Navigation

GPS Receiver

- Antenna
- Body
- Battery

How does it work?

- You need at least 4 satellites to determine your location!
 - 4 dimensions
 - Latitude (Y)
 - Longitude (X)
 - Elevation (Z)
 - Time (T)
- Therefore, you need information from four satellites!

● Distance measurement

start: 0.00 s

20,200 km

end: 0.06 s

- Information from these four satellites are used to solve:
 - Distance = Velocity x Time
- Velocity = speed of light
- If you have 3 satellites, the receiver will guess at your elevation and give you latitude and longitude

The Global Positioning System

Measurements of code-phase arrival times from at least four satellites are used to estimate four quantities: position in three dimensions (X, Y, Z) and GPS time (T).

Triangulation

- 1 satellite

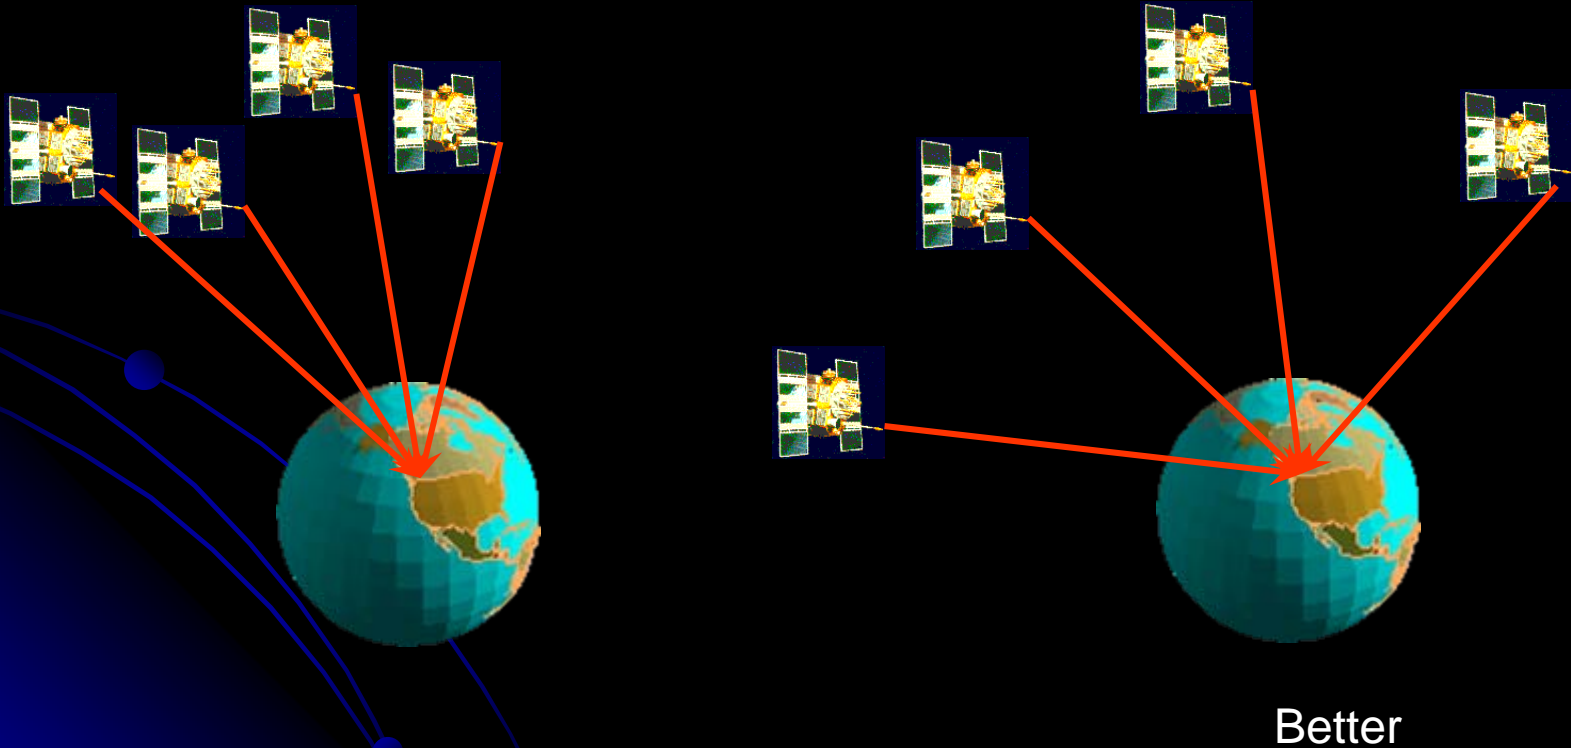

- 2 satellites

- 3 satellites

- Wider spread gives better precision

Source of error

- Selective availability
- Atmospheric delay
- Multipath error

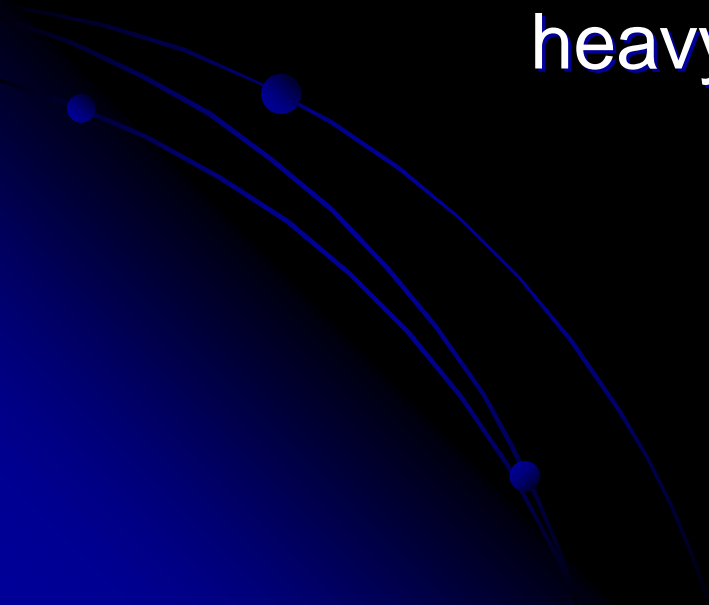

Selective Availability (S/A)

- To discourage enemy forces from using GPS
- US government induced artificial errors to reduce GPS position accuracy
- Sometimes S/A is **ON** and sometimes it is **OFF**.

No more S/A since May 1, 2000

Atmospheric Delay

- GPS signals are slightly delayed while they pass through the atmosphere
 - For best results, don't use GPS receiver during lightning, storm or heavy rain.
- 

Multipath Error

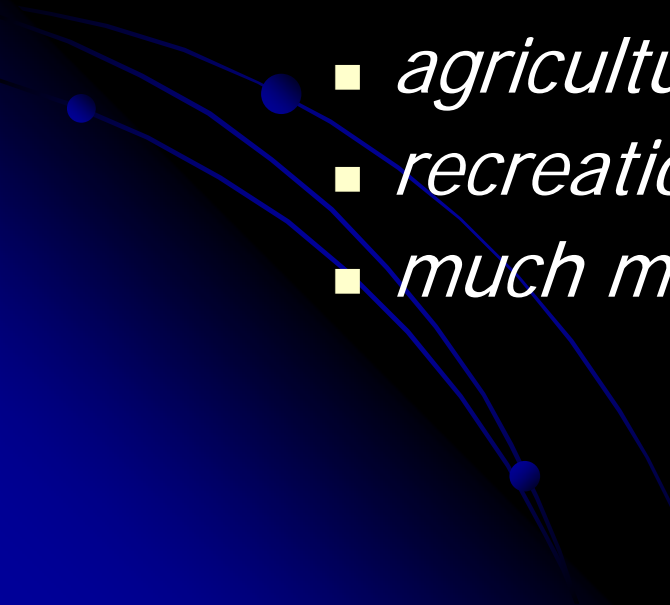

- Occurs when the GPS signal is reflected off an object before it reaches your GPS receiver

Mountain, building

Applications

- Multiple applications include:
 - *GIS data capture*
 - *Vehicle tracking*
 - *marine/vehicle navigation*
 - *surveying*
 - *aviation*
 - *agriculture*
 - *recreation*
 - *much more...*
- 

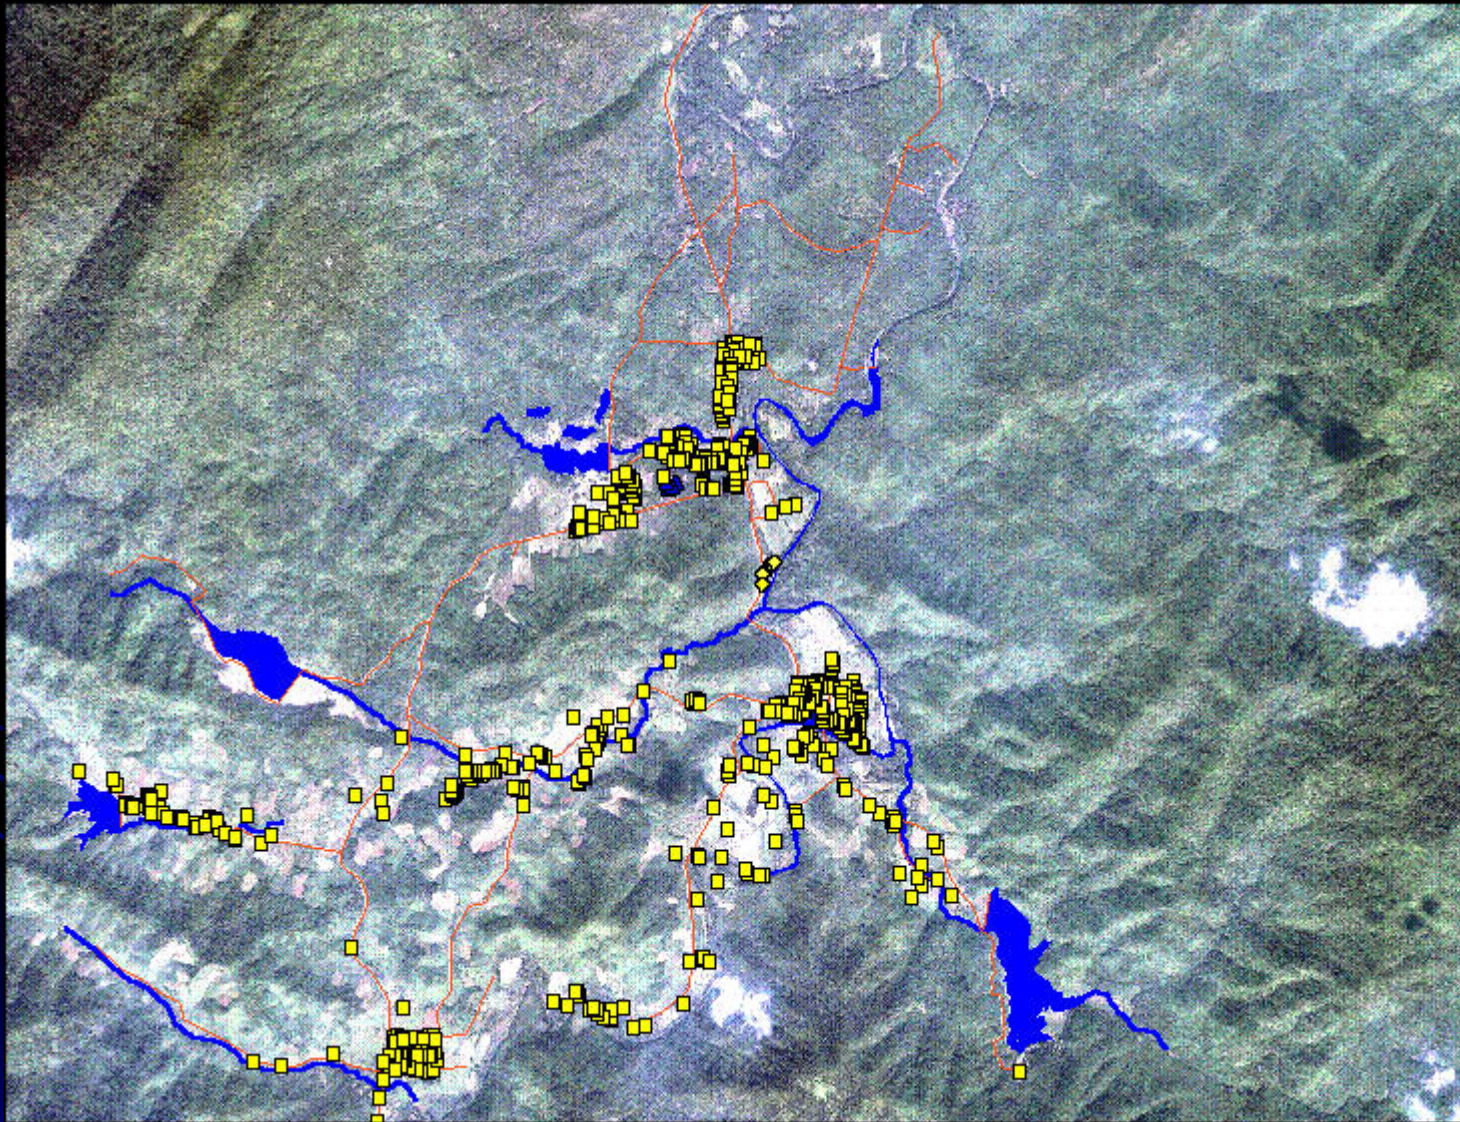

GIS Data Capture

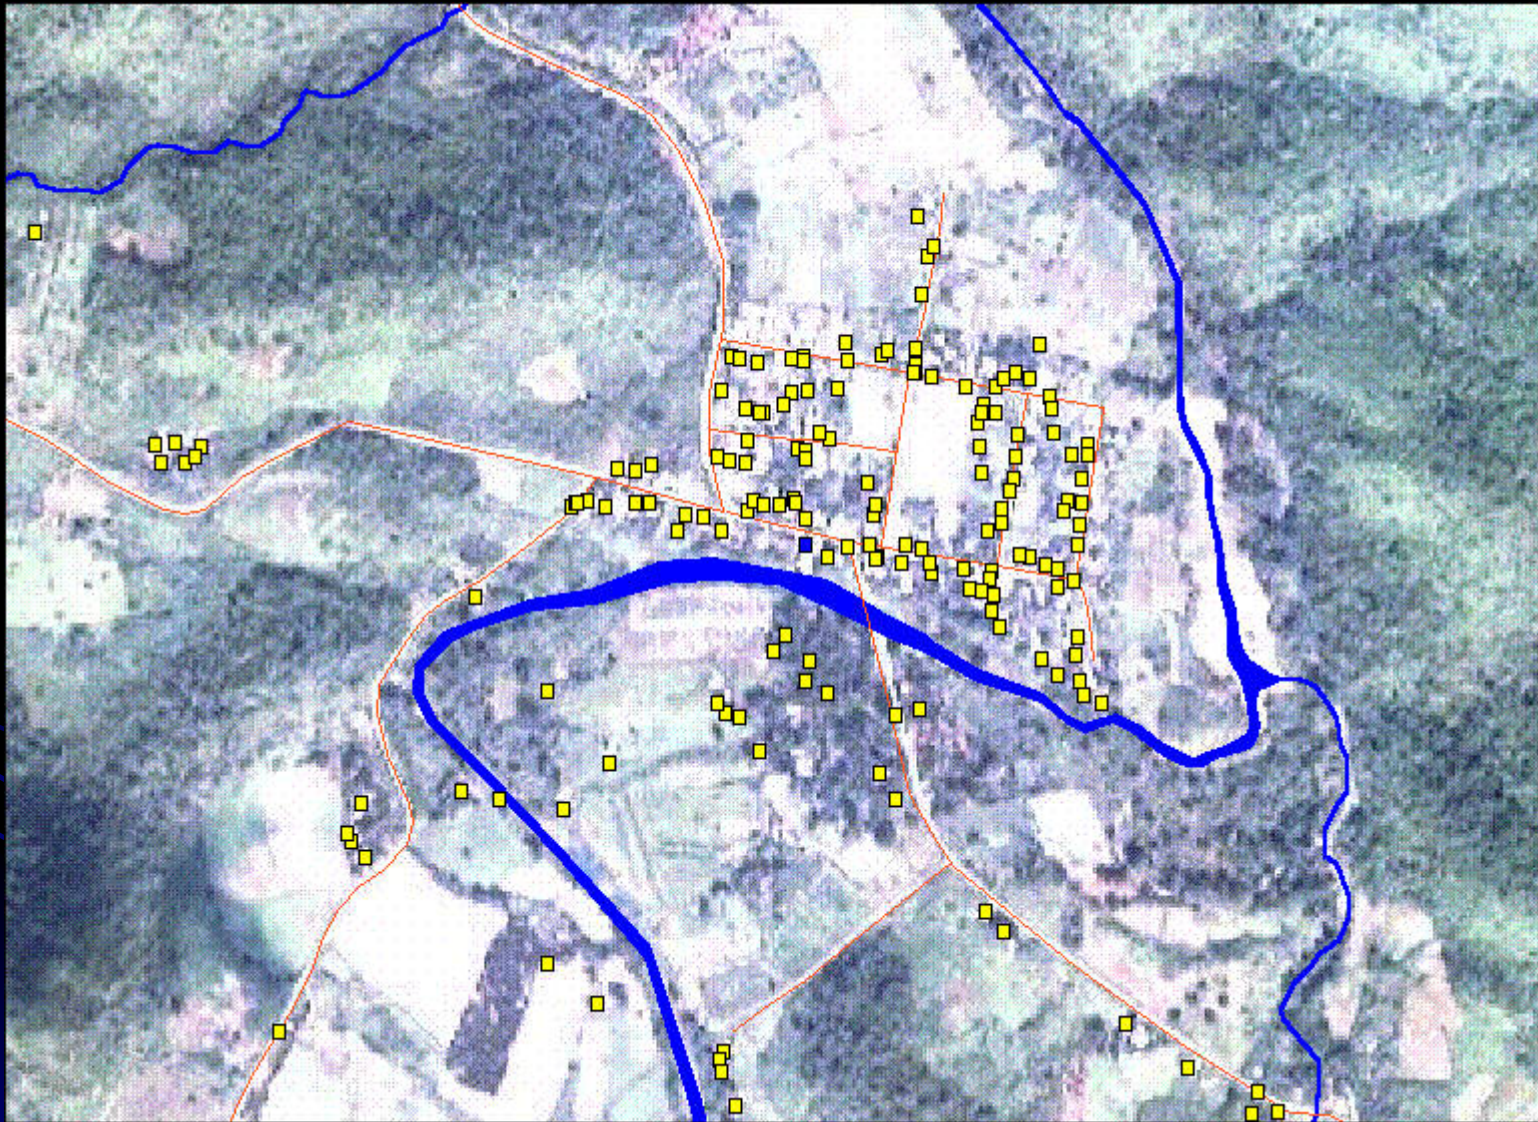

Mapping the water reservoir

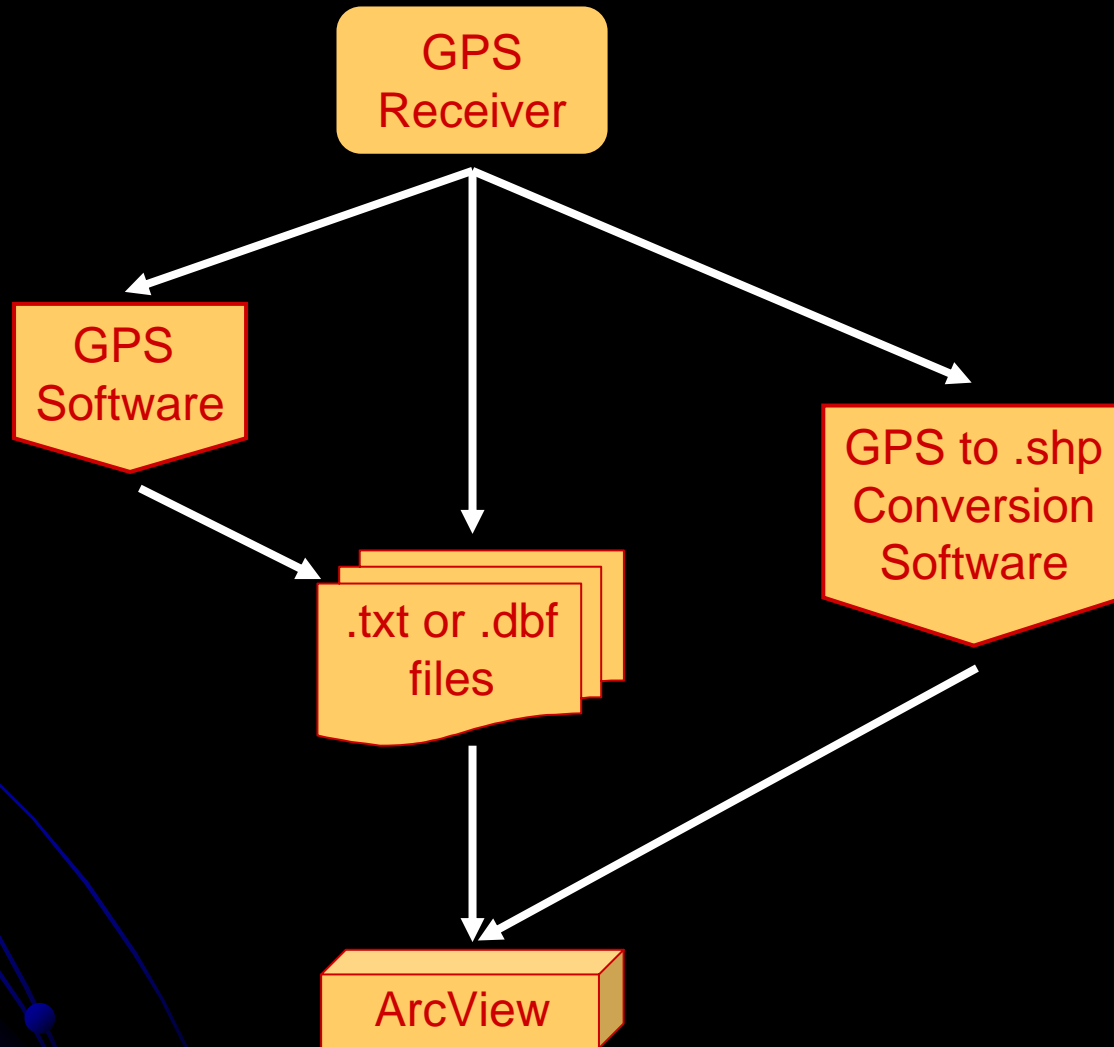

Import GPS data to ArcView 3.x

● GPS Softwares

- MapSource® -- Garmin
- GPS TrackMaker -- freeware
- EasyGPS – freeware
- etc

● Conversion software

- DNR Garmin -- ArcView extension

(<http://www.dnr.state.mn.us/mis/gis/tools/arcview/index.html>)

Import GPS data to Google Earth

- Connect GPS receiver to computer
- Run program MapSource® or EasyGPS®
- Read data from the GPS receiver
- Save file (file type = .gpx)
- Run GoogleEarth
- Open your .gpx file

MapSource®

Version 6.8.0
